

What is claimed is:

1. A security device for electrical cords, comprising:

a housing having a base and a plurality of side members;

an electrical output operatively engaged to a support, said support integrally connected to said housing;

an electrical input operatively engaged to said housing and electrically connected to said electrical output;

a plurality of securement grooves for securing at least one slidable plate;

a switch having a first position and a second position to control electrical flow between said electrical input and said electrical output; and

a lock member to selectively lock said switch into one of said first position or said second position.

2. A method for securing an electrical cord of an electrically powered device, said method comprising the steps of:

inserting an electrical cord of an electrically powered device into an electrical output of a security device having a housing;

passing said electrical cord into said security device between said housing and at least one plate positioned in a groove within said housing;

securing a cover to said housing to prevent unauthorized access to said electrically powered device.
